Introduction

- The framework of this work the design of a multirobot system.
- We take the point of view of a monitoring system of the global multirobot system.
- The robot work is in outdoor environment, therefore the illumination conditions will vary slowly depending of weather conditions.
- The multirobot system task is the washing of ship holds. In this context most surfaces in the environment will be wetted.
 - The shines are a good descriptor of physical scene structure
 - The specular component is important in an image normalization process.
- We propose an approach to estimate the image specular component based on the Dichromatic Reflection Model and the Legendre polynomials.

Dichromatic Reflection Model

- The dichromatic reflection model was proposed by Shafer [1]
- The dichromatic reflection model describes the surface reflection of light in dielectric materials as the sum of two components, the diffuse and specular terms.
- The diffuse reflection component exhibits the color of the material. Different light wavelengths are more or less absorbed as light is scattered by the material.
- The specular reflection component is essentially determined by the color of incident light.

Dichromatic Reflection Model

Normalized RGB (r + g + b = 1)

Df Diffuse component Sp Specular component Wd Weighting factor of Df

Ws Weighting factor of Sp

I Sample Intensity value

Chromaticity Space for DRM

Model of the image taken with a digital camera

$$I(x) = w_d(x) \int_{\Omega} S(\lambda, x) E(\lambda) q(\lambda) d\lambda + w_s(x) \int_{\Omega} E(\lambda) q(\lambda) d\lambda \qquad (1)$$

$$I(x) = w_d(x)B + w_s(x)G \tag{2}$$

- $I = \{I_r, I_g, I_b\}$ is the color of an image pixel obtained through a camera sensor.
- $x = \{x, y\}$ are the two dimensional coordinates of the pixel in the image.
- ullet $q=\{q_r,q_g,q_b\}$ is the three element vector of sensor sensitivity.
- $w_d(x)$ and $w_s(x)$ are the weighting factors for diffuse and specular components, respectively. They depend on the geometric structure at location x.
- $S(\lambda, x)$ is the diffuse spectral reflectance.
- $E(\lambda)$ is the illumination spectral power distribution function, it is independent of the spatial location x because we assume a uniform illumination color.

Chromaticity

Normalized RGB

$$\sigma(x) = \frac{I(x)}{I_r + I_o + I_b} \tag{3}$$

Diffuse Chromaticity

$$\Lambda(x) = \frac{B(x)}{B_r + B_o + B_b} \tag{4}$$

Specular or Illumination Source Chromaticity

$$\Gamma = \frac{G}{G_r + G_g + G_b} \tag{5}$$

Image model expressed in terms of chromaticity

$$I(x) = m_d(x)\Lambda(x) + m_s(x)\Gamma$$
 (6)

Where
$$m_d(x) = w_d(x) \left[B_r(x) + B_g(x) + B_b(x) \right]$$
 and $m_s(x) = w_s(x) \left(G_r + G_g + G_b \right)$

- We can see that the diffuse chromaticity depend of location x, however the specular chromaticity doesn't depend on location x because we assume a uniform illumination color, and both weighting factors depend on the geometric structure at location x.
- In addition, from their definitions we can obtain:

$$(\sigma_r + \sigma_g + \sigma_b) = (\Lambda_r + \Lambda_g + \Lambda_b) = (\Gamma_r + \Gamma_g + \Gamma_b) = 1$$

 Experimental Results

Normalization

- ullet The specular component must be pure white $(\Gamma_r = \Gamma_g = \Gamma_b)$
- ullet This process requires the value of Γ^{est}

Normalized Image

$$I'(x) = \frac{I(x)}{\Gamma^{est}(x)}$$

$$I'(x) = m'_d(x)\Lambda'(x) + \frac{m'_s(x)}{3}$$
 (7)

Renormalization

$$m_d(x)\Lambda(x) = [m'_d(x)\Lambda'(x)]\Gamma^{est}$$
(8)

$$m_s(x)\Gamma = \left\lceil \frac{m_s'(x)}{3} \right\rceil \Gamma^{est}$$

Specular-Free Two-Band Image Generation

$$I'(x) = m'_d(x)\Lambda'(x) + m'_s(x)/3$$

$$\tilde{I}(x) = \min\{I_r'(x), I_g'(x), I_b'(x)\}$$

$$\tilde{\Lambda}(x) = \min\{\Lambda'_r(x), \Lambda'_g(x), \Lambda'_b(x)\}$$

$$\tilde{I}(x) = m'_d(x)\tilde{\Lambda}(x) + \frac{m_s}{3} \tag{10}$$

Specular-free two-band [4]

$$I^{sf}(x) = I'(x) - \tilde{I}(x) = m'_d(x) \left[\Lambda'(x) - \tilde{\Lambda}(x) \right]$$

Diffuse Regions

- We can find diffuse regions which have some properties:
 - Two neighboring pixels have the same chromaticity
 - We detect and reject color border pixels
 - We detect and reject noise pixels
- Under this assumptions we can find diffuse pixels, and the rest must be specular pixels

Separation Method

A diffuse pixel in a normalized image

$$I'(x) = m'_d(x)\Lambda'(x) + m'_s(x)/3$$

$$I'(x) = m'_d(x)\Lambda'(x)$$

$$I'(x) = m'_d(x)\Lambda'$$

$$log(I'(x)) = log(m'_d(x) + log(\Lambda'))$$

$$\frac{\partial}{\partial x}log(I'(x)) = \frac{\partial}{\partial x}log(m'_d(x))$$

A pixel in a Specular Free Image

$$I^{sf}(x) = m'_d(x)\Lambda^{sf}(x)$$

$$I^{sf}(x) = m'_d(x)\Lambda^{sf}$$

$$log(I^{sf}(x)) = log(m'_d(x) + log(\Lambda^{sf}))$$

$$\frac{\partial}{\partial x}log(I^{sf}(x)) = \frac{\partial}{\partial x}log(m'_d(x))$$

http://www.ehu.es/ccwintco

The method is based on the difference of the image logarithm differentials

$$\triangle(x) = dlog(I'(x)) - dlog(I^{sf}(x))$$
 (12)

if $\triangle(x) = 0$, then is a diffuse pixel 0110010011011111010001

We are adapting the ideas about intensity inhomogeneity correction in MRI [2] to our problem.

Energy Function

$$E_{tot} = \sum_{x \in Inorm} (I^{norm}(x) - bm_s(x, p) - \mu_k(x))^2$$
 (13)

$$bm_s(x,p) = \sum_{i=0}^{l} \sum_{j=0}^{l} p_{i,j} P(i) P(j)$$

Evolutionary algorithm goal

The evolutionary algorithm must look for the correct Legendre polynomial parameters, to find a good approximation to the Specular field bms

The experiment

- The picture was taken in a real ship hold.
- There are two workers. They wear clothes of color similar to the floor, and they are in a shine region.
- We try to reduce the reflections to obtain a corrected image.
- In the corrected image we can find easily the workers.
- The corrected images add robustness to system.
